*Evaluating Critical Care* 2012-12-06 measuring the quality of a complex service like critical care that combines the highest technology with the most intimate caring is a challenge recently consumers clinicians and payers have requested more formal assessments and comparisons of the quality and costs of medical care 2 donabedian 1 proposed a framework for thinking about the quality of medical care that separates quality into three components structure process and outcome an instructive analogy for understanding this framework is to imagine a food critic evaluating the quality of a restaurant the critic might comment on the decoration and lighting of the restaurant how close the tables are to each other the extent of the wine list and where the chef trained these are all evaluations of the restaurant structure in addition the critic might comment on whether the service was courteous and timely measures of process finally the critic might comment on outcomes like customer satisfaction or food poisoning similarly to a health care critic structure is the physical and human resources used to deliver medical care processes are the actual treatments offered to patients finally outcomes are what happens to patients for example mortality quality of life and satisfaction with care table 1 there is a debate about which of these measurements is the most important measure of quality

*Surviving Intensive Care* 2012-12-06 for many years intensive care has focused on avoiding immediate death from acute life threatening conditions however there are increasing reports of a number of lingering consequences for those who do indeed survive intensive care examples include ongoing high risk of death neurocognitive defects significant caregiver burden and continued high healthcare costs surviving intensive care written by the world's experts in this field

area is dedicated to better understanding the consequences of surviving intensive care and is intended to provide a synopsis of the current knowledge and a stimulus for future research and improved care of the critically ill

*Critical Care Psychology and Rehabilitation* 2021-12-03 when contemplating the broad field of critical care and all of its complexities rehabilitation and psychology practice is not likely among the top ten services that clinicians patients or the public think of and rightly so the vast majority of patients who require intensive care arrive at death s door and many linger in a limbo like space somewhere between life and the afterlife the primary focus at this juncture is often on pressing matters such as reestablishing and stabilizing basic bodily functions optimizing life saving machine settings and deciding who does and does not need additional urgent interventions still just beneath the surface of this fascinating multilayered environment the need for psychologists and rehabilitation oriented clinicians is everywhere in large part because intensive care stands among the most emotionally intense and physically taxing hospital based settings for everyone involved patients families caregivers and staff alike despite this recognition that psychologists and rehabilitation oriented professionals could and should be more integrated within the critical care team is uncommon in fact it can be argued that some european countries are ahead of the united states us in this regard agarwala ahmed patil 2011 andreoli novaes karam knobel 2001 jackson jutte 2016 peris et al 2011 sukantarat greer brett williamson 2007 tan brett stokes 2009 van den born van zanten dongelmans dettling ihnenfeldt vink van der schaaf 2016 fortunately there are growing integrative trends in the us in 2010 a conference was convened by the society of critical care medicine sccm with broad goals to inform stakeholders about the multiple long term consequences of critical illness e g postintensive care syndrome pics and initiate

*Post-Intensive Care Syndrome* 2019-08-31 this book part of the european society of intensive care medicine textbook series provides detailed up to date information on the physical cognitive and psychological impairments that are frequently present following a stay in an intensive care unit and examines in depth the available preventive and therapeutic strategies including adapted rehabilitation programs beyond acquainting readers with the multiple facets of post intensive care syndrome pics the book aims to promote the effective follow up of

patients thereby enhancing their ability to work and their functional autonomy and to identify risk factors for the development of PICUs as a stimulus to beneficial organizational changes in intensive care departments the background to the book is the realization by healthcare providers that the quality of life of patients who have required a stay in an intensive care unit can be severely impaired or even become unacceptable all too often the diverse sequelae are overlooked by specialists of other disciplines moreover families and caregivers are also at high risk of post traumatic stress disorder and depression the European Society of Intensive Care Medicine has developed the Lessons from the ICU series with the vision of providing focused and state of the art overviews of central topics in intensive care and optimal resources for clinicians working in intensive care this book written by renowned experts in the field will facilitate the transmission of key knowledge with significant clinical and financial benefits

Organisation and Management of Intensive Care 2012-12-06 from the viewpoint of a health economist the intensive care unit is a particularly fascinating phenomenon it is the epitome of high tech medicine and frequently portrayed as the place where life saving miracles are routinely wrought but the popular imagination is also caught up in the darker side when agonizing decisions have to be made to avoid futile and inhuman continuation of expensive treatments my analytical interests led me to approach these issues by asking what the evidence tells us about which ICU activities are very beneficial in relationship to their costs and which are not this quickly translates into a slightly different question namely which patients are most appropriately treated in an ICU and which not unfortunately it is very hard to answer these questions because it has proved very difficult to investigate these issues in the manner which is now regarded as the gold standard namely by conducting randomized clinical trials or alternative courses of action i think this is a pity and i am not at all convinced that it would be unethical to do so in many cases because there is wide variation in practice and genuine doubt as to which practices are best the two conditions that need to be fulfilled before such a trial is justifiable
