many new challenges have arisen in the area of oncology clinical trials new cancer therapies are often based on cytostatic or targeted agents which pose new challenges in the design and analysis of all phases of trials the literature on adaptive trial designs and early stopping has been exploding inclusion of high dimensional data and imaging techniques have become common practice and statistical methods on how to analyse such data have been refined in this area a compilation of statistical topics relevant to these new advances in cancer research this third edition of handbook of statistics in clinical oncology focuses on the design and analysis of oncology clinical trials and translational research addressing the many challenges that have arisen since the publication of its

predecessor this third edition covers the newest developments involved in the design and analysis of cancer clinical trials incorporating updates to all four parts phase i trials updated recommendations regarding the standard 3 3 and continual reassessment approaches along with new chapters on phase 0 trials and phase i trial design for targeted agents phase ii trials updates to current experience in single arm and randomized phase ii trial designs new chapters include phase ii designs with multiple strata and phase ii iii designs phase iii trials many new chapters include interim analyses and early stopping considerations phase iii trial designs for targeted agents and for testing the ability of markers adaptive trial designs cure rate survival models statistical methods of imaging as well as a thorough review of software for the design and analysis of clinical trials exploratory and high dimensional data analyses all chapters in this part have been thoroughly updated since the last edition new chapters address methods for analyzing snp data and for developing a score based on gene expression data in addition chapters on risk calculators and forensic bioinformatics have been added accessible to statisticians and oncologists interested in clinical trial methodology the book is a single source collection of up to date statistical approaches to research in clinical oncology

the introduction of nuclear medicine into oncology dates back to the early 1940s when Lawrence reported on the tumor retention of ^{32}P phosphate von Hevesy and von Euler soon afterwards published their fundamental work on the metabolism of phosphorus in sarcoma cells and when almost at the same time Keston and his coworkers described their observation of the accumulation of radioactive iodine in metastases of a thyroid carcinoma since that time innumerable publications have appeared in oncologic literature which deal with the application of nuclear medical methods in experimental cancer research and also in the diagnosis and treatment of malignant tumors the significance of some originally very successfully applied clinical methods naturally has changed over the years for instance scintigraphy became somewhat less important for the purely morphologic assessment of certain tumors after the introduction of transmission computerized tomography and modern sonographic methods into clinical practice on the other hand however it has also been

possible to further develop scintigraphy to a decisive extent both with reference to the test substances applied and in view of the instrumentation as far as the scintigraphic equipment is concerned the introduction of static and sequential digital imaging by means of scintillation camera computer systems in the mid 1960s represents important progress as does the recent development of emission computerized tomography with single photon and positron emitters
